Note: Within nine months from the publication of the mention of the grant of the European patent, any person may give notice to the European Patent Office of opposition to the European patent granted. Notice of opposition shall be filed in a written reasoned statement. It shall not be deemed to have been filed until the opposition fee has been paid. (Art. 99(1) European Patent Convention).

Description

[0001] This invention relates to a novel form of 2-methyl-4-(4-methyl-1-piperazinyl)-10H-thieno[2,3-b][1,5]benzodiazepine (hereinafter referred to by its generic name "olanzapine"), more specifically to a novel crystalline form of that compound and to pharmaceutical formulations containing that novel form as an active ingredient.

[0002] A novel crystal form of olanzapine has now been synthesized and characterized which possesses distinct advantages over the previously known form, that is the material produced using the methods described in U.S. Patent No. 5,229,382 (hereinafter referred to as "the '382 patent"), and which is clearly distinguishable therefrom by x-ray powder diffractometry. The first form of olanzapine (hereinafter referred to as "Form I"), as prepared by the procedures described in the '382 patent, has been found to be metastable and not well suited for commercial use in pharmaceutical formulations. However, in accordance with the present invention, a newly discovered second polymorph of olanzapine, which will be designated hereinafter as "Form II", has been found to be obtainable in highly pure form, that is free from Form I and contamination by solvates such as water or acetonitrile, is stable, pharmaceutically elegant, and therefore well adapted for commercial use in pharmaceutical formulations such as tablets.

[0003] Olanzapine has shown great promise in the treatment of psychotic patients and is currently being evaluated for that purpose. Unfortunately, olanzapine prepared using the methods described in the '382 patent typically exhibits a color which is undesirable for commercial pharmaceutical use, especially since the color was found to change over time on exposure to air. Even carbon treatment of the olanzapine prepared using the methods described in the '382 patent does not remove all of the undesired color. Such a pharmaceutical which changes color over time could be particularly troublesome for psychotic patients if a dosage form, such as a tablet, were to be chosen where color changes were apparent. Therefore, greater purity and freedom from color change are desirable. The novel polymorph of this invention provides precisely the longed for pharmaceutically elegant and desirable properties needed for a drug to be administered to psychotic patients, and has satisfactory color stability and is substantially free of undesired solvating agents such as water and acetonitrile.

[0004] The present invention provides Form II olanzapine polymorph having a typical x-ray powder diffraction pattern as represented by the following interplanar spacings:

d

10.2689
8.577
7.4721
7.125
6.1459

2.8102	1.47
2.7217	0.20
2.6432	1.26
2.6007	0.77

[0006] The x-ray diffraction patterns set out herein were obtained using a Siemens D5000 x-ray powder diffractometer having a copper K_α radiation source of wavelength, $\lambda=1.541\text{\AA}$.

EP 0 733 635 B1

[0007] The invention further provides the Form II polymorph in substantially pure form.

[0008] The present invention also provides a pharmaceutical formulation, such as a tablet, comprising Form II as an active ingredient, associated with one or more pharmaceutical acceptable excipients. In another embodiment of the invention, there is provided a method for using Form II for treating a psychotic condition, mild anxiety, gastrointestinal conditions and for providing pharmaceutical formulations for use in such methods.

[0009] The polymorph obtainable by the process taught in the '382 patent will be designated as Form I and has a typical x-ray powder diffraction pattern substantially as follows, obtained using a Siemens D5000 x-ray powder diffractometer, wherein d represents the interplanar spacing:

	d
10	9.9463
	8.5579
	8.2445
15	6.8862
	6.3787
	6.2439
	5.5895
	5.3055
20	4.9815
	4.8333
	4.7255

2.8172	2.89
2.7589	2.27
2.6597	1.86
2.6336	1.10
2.5956	1.73

[0011] The x-ray powder diffraction patterns herein were obtained with a copper K_α of wavelength $\lambda = 1.541\text{\AA}$. The interplanar spacings in the column marked "d" are in Angstroms. The typical relative intensities are in the column marked "I/I₁".

[0012] The novel form of olanzapine provided by this invention is rather difficult to prepare in substantially pure form. However, in accordance with the invention, it has been discovered that when olanzapine of reasonably high purity, that is of technical grade (that is olanzapine containing less than about 5% undesired related substances and preferably less than about 1% undesired related substances and see Example 1), is dissolved in ethyl acetate under anhydrous conditions, Form II can be crystallized out of the solution so formed in substantially pure form, that is free from the undesired polymorph or solvates such as water or acetonitrile. Anhydrous conditions refer to less than one percent water present in the ethyl acetate.

[0013] In preparing Form II according to the invention, the technical grade olanzapine can be dissolved in the ethyl acetate by agitation such as stirring and the like. Crystallization from the resulting solution can be by any conventional process including seeding, chilling, scratching the glass of the reaction vessel, and other such common techniques.

[0014] As used herein "substantially pure" refers to Form II associated with less than about 5% Form I, preferably less than about 2% Form I, and more preferably less than about 1% Form I. Further, "substantially pure" Form II will contain less than about 0.5% related substances, wherein "related substances" refers to undesired chemical impurities or residual solvent or water. In particular, "substantially pure" Form II should contain less than about 0.05% content of acetonitrile, more preferably, less than about 0.005% content of acetonitrile. Additionally, the polymorph of the invention should contain less than 0.5% of associated water.

[0015] Advantageously, the novel polymorph of the invention will be free from solvates, for instance existing as the anhydrate.

[0016] Pharmaceutical formulations containing Form II should contain less than about 10% Form I, more preferably

less than about 5% Form I polymorph.

[0017] Olanzapine has useful central nervous system activity. This activity has been demonstrated using well-established procedures, for example, as described in the '382 patent. Form II provided by the present invention appears to have the same profile of receptor activity and has the same therapeutic uses as olanzapine described in the '382 patent.

Therefore, Form II is useful for the treatment of schizophrenia, schizophreniform disorders, psychosis, mild anxiety states, and functional bowel disorders.

[0018] Form II is effective over a wide dosage range, the actual dose administered being dependent on the condition being treated. For example, in the treatment of adult humans, dosages of from about 0.25 to 50 mg, preferably from 1 to 30 mg, and most preferably 1 to 20 mg per day may be used. A once a day dosage is normally sufficient, although divided doses may be administered. For treatment of central nervous system disorders, a dose range of from 1 to 30 mg, preferably 2.5 to 20 mg per day is suitable.

[0019] Form II will normally be administered orally and, for this purpose, it is usually employed in the form of a pharmaceutical formulation.

[0020] Accordingly, pharmaceutical formulations comprising Form II as active ingredient, associated with a pharmaceutically acceptable carrier may be prepared. In making the compositions of the invention conventional techniques for the preparation of pharmaceutical compositions may be used. For example, the active ingredient will usually be mixed with a carrier, or diluted by a carrier, or enclosed within a carrier which may be in the form of a capsule, sachet, paper or other container. When the carrier serves as a diluent, it may be solid, semi-solid or liquid material which acts as a vehicle, excipient or medium for the active ingredient. The active ingredient can be adsorbed on a granular solid container for example in a sachet. Some examples of suitable carriers are lactose, dextrose, sucrose, sorbitol, mannitol, starches, gum acacia, calcium phosphate, alginates, tragacanth, gelatin, syrup, methyl cellulose, methyl- and propyl-hydroxy-benzoate, talc, magnesium stearate or mineral oil. The compositions of the invention may, if desired, be formulated so as to provide quick, sustained or delayed release of the active ingredient after administration to the patient. For example, one such preferred quick release formulation is described in U.S. Patent Nos. 5,079,018, 5,039,540, 4,305,502, 4,758,598, and 4,371,516, hereby incorporated by reference.

[0021] Depending on the method of administration, the compositions for the treatment of central nervous system conditions may be formulated as tablets, capsules, gel or suspension for transdermal delivery, suspensions or elixirs for oral use or suppositories. Preferably the compositions are formulated in a unit dosage form, each dosage containing from 0.25 to 100 mg, more usually 1 to 30 mg, of the active ingredient. When a sustained release formulation is desired, the unit dosage form may contain from 0.25 to 200 mg of the active ingredient. A preferred formulation of the invention is a capsule or tablet comprising 0.25 to 75 mg or 1 to 30 mg of active ingredient together with a pharmaceutically acceptable carrier therefor.

[0022] The starting materials for the present invention can be prepared by a variety of procedures well known to those of ordinary skill in the art. The material to be employed as starting materials in the process of this invention can be prepared by the general procedure taught by Chakrabarti in U.S. Patent No 5,229,382 ('382), herein incorporated by reference in its entirety.

[0023] The following examples are provided for purposes of illustration and are not to be construed as limiting the scope of the claimed invention.

[0024] Compound characterization methods include, for example, x-ray powder pattern analysis, thermogravimetric analysis (TGA), differential scanning calorimetry (DSC), titrametric analysis for water, and H^1 -NMR analysis for solvent content.

Example 1

Technical Grade olanzapine

[0025]

Intermediate 1

[0026] In a suitable three neck flask the following was added:

Dimethylsulfoxide (analytical):	6 volumes
Intermediate 1 :	75 g
N-Methylpiperazine (reagent) :	6 equivalents

Intermediate 1 can be prepared using methods known to the skilled artisan. For example, the preparation of the Intermediate 1 is taught in the '382 patent.

[0027] A sub-surface nitrogen sparge line was added to remove the ammonia formed during the reaction. The reaction was heated to 120°C and maintained at that temperature throughout the duration of the reaction. The reactions were followed by HPLC until ≤ 5% of the intermediate 1 was left unreacted.

[0028] After the reaction was complete, the mixture was allowed to cool slowly to 20°C (about 2 hours). The reaction mixture was then transferred to an appropriate three neck round bottom flask and water bath. To this solution with agitation was added 10 volumes reagent grade methanol and the reaction was stirred at 20°C for 30 minutes. Three volumes of water was added slowly over about 30 minutes. The reaction slurry was cooled to zero to 5°C and stirred for 30 minutes. The product was filtered and the wet cake was washed with chilled methanol. The wet cake was dried in vacuo at 45°C overnight. The product was identified as technical olanzapine.

Yield: 76.7%; Potency: 98.1%

Example 2

Form II

[0029] A 270.g sample of technical grade 2-methyl-4-(4-methyl-1-piperazinyl)-10H-thieno[2,3-b][1,5]benzodiazepine was suspended in anhydrous ethyl acetate (2.7 L) . The mixture was heated to 76°C and maintained at 76°C for 30 minutes. The mixture was allowed to cool to 25°C. The resulting product was isolated using vacuum filtration. The product was identified as Form II using x-ray powder analysis. Yield: 197 g.

[0030] The process described above for preparing Form II provides a pharmaceutically elegant product having potency > 97%, total related substances < 0.5% and an isolated yield of > 73%.

EXAMPLE 3

Tablet Formulation

[0031] A tablet formulation was made by granulating the active with appropriate diluent, lubricant, disintegrant and binder and compressing

Form II olanzapine	10.0 mg
Magnesium stearate	0.9 mg
Microcrystalline cellulose	75.0 mg
Povidone	15.0 mg
Starch, directly compressible	204.1 mg

Example 4

Tablet Formulation

[0032] A portion of hydroxypropyl cellulose was dissolved in purified water to form a solution for granulation. The remaining hydroxypropyl cellulose (total of 4.0% w/w final tablet weight), which was an extra fine grade, was combined with the Form II (1.18% w/w), lactose (79.32% w/w) and a portion of crospovidone (5% w/w) in a high shear granulator. All ingredients were security sieved prior to addition and dry blended in the granulator. This mixture was then granulated with the hydroxypropyl cellulose solution in the high shear granulator. The granulation was wet sized using standard methods. The wet granulation was then dried in a fluidized bed dryer and sized. The material was then added to a tumble bin mixer.

[0033] The outside powders consisting of microcrystalline cellulose (granular) (10% w/w), magnesium stearate (0.5% w/w), and the remainder of the crospovidone were added to the sized granulation. The mixture was blended and compressed with the appropriate tooling on tablet compression equipment.

Subcoating:

[0034] Hydroxypropyl methylcellulose (1.5% w/w) was mixed with purified water to form a solution. Core tablets were divided into approximately equal sections and spray coated with the hydroxypropyl methylcellulose solution. The operation was performed in a perforated coating pan.

Coating of Core Tablets:

[0035] Color Mixture White (hydroxypropyl methylcellulose, polyethylene glycol, polysorbate 80, and titanium dioxide) was mixed with purified water to form the coating suspension. Subcoated tablets were divided into approximately equal sections and spray coated with the coating suspension described above. The operation was performed in a perforated coating pan.

[0036] The coated tablets were lightly dusted with carnauba wax and imprinted with appropriate identification.

Claims

1. Form II olanzapine polymorph having a typical x-ray powder diffraction pattern as represented by the following interplanar spacings:

d (Å)
10.2689
8.577
7.4721
7.125
6.1459
6.071
5.4849

EP 0 733 635 B1

3. Form II as claimed in Claim 2 which contains less than about 2% content of Form I.
4. Form II as claimed in any one of Claims 1 to 3 which is solvate free.
5. Form II as claimed in any one of Claims 1 to 4 which is anhydrous.
6. A pharmaceutical formulation comprising as an active ingredient Form II as claimed in any one of Claims 1 to 5 associated with one or more pharmaceutically acceptable carriers, excipients, or diluents therefor.
7. A pharmaceutical formulation as claimed in Claim 6 which is a tablet.
8. A pharmaceutical formulation as claimed in Claim 6 which is a capsule or tablet comprising 1 to 30 mg of Form II together with a pharmaceutically acceptable carrier therefor.
9. A process for preparing Form II as claimed by any one of Claims 1 to 5 comprising slurring technical grade olanzapine in ethyl acetate under anhydrous conditions and crystallizing Form II from the solution so formed.
10. Form II olanzapine polymorph as claimed in any one of Claim 1 to 5 for use in treating a condition selected from the group consisting of psychosis, schizophrenia, a schizophrenic form disorder, mild anxiety, a gastrointestinal disorder, and acute mania.
11. Form II olanzapine polymorph according to Claim 1 which is solvate free.
12. Form II as claimed in Claim 11 which contains less than about 5% Form I as hereinbefore defined.
13. Form II as claimed in either of Claims 11 or 12 which is anhydrous.
14. A pharmaceutical formulation comprising as an active ingredient Form II as claimed in any one of Claims 11 to 13 associated with one or more pharmaceutically acceptable carriers, excipients, or diluents therefor.
15. A pharmaceutical formulation as claimed in Claim 14 which is a tablet.
16. A pharmaceutical formulation as claimed in Claim 14 which is a capsule or tablet comprising 1 to 30 mg of Form II together with a pharmaceutically acceptable carrier therefor.
17. Form II as claimed by any one of Claims 11 to 13 for use in treating a condition selected from the group consisting of psychosis, schizophrenia, a schizophrenic form disorder, mild anxiety, a gastrointestinal disorder, and acute mania.

Patentansprüche

1. Olanzapinpolymorph der Form II mit dem folgenden typischen Röntgenbeugungsmuster am Pulver, wie dies durch die folgenden Interplanarabstände gezeigt wird:

d (Å)	d (Å) (Fortsetzung)

3. Form II nach Anspruch 2, die weniger als etwa 2 % Gehalt an Form I aufweist.
4. Form II nach einem der Ansprüche 1 bis 3, die solvatrei ist.

EP 0 733 635 B1

5. Form II nach einem der Ansprüche 1 bis 4, die wasserfrei ist.
6. Pharmazeutische Formulierung, die als Wirkstoff die Form II nach einem der Ansprüche 1 bis 5 zusammen mit einem oder mehreren pharmazeutisch annehmbaren Trägern, Hilfsstoffen oder Verdünnungsmitteln hierfür enthält.
7. Pharmazeutische Formulierung nach Anspruch 6, die eine Tablette ist.
8. Pharmazeutische Formulierung nach Anspruch 6, die eine Kapsel oder Tablette ist, welche 1 bis 30 mg der Form II zusammen mit einem pharmazeutisch annehmbaren Träger hierfür enthält.
9. Verfahren zur Herstellung der Form II nach einem der Ansprüche 1 bis 5, gekennzeichnet durch Aufschlämmung von Olanzapin technischer Reinheit in Ethylacetat unter wasserfreien Bedingungen und Kristallisierung der Form II aus der so gebildeten Lösung.
10. Olanzapinpolymorph der Form II nach einem der Ansprüche 1 bis 5 zur Verwendung bei der Behandlung eines Zustands, ausgewählt aus der Gruppe, die besteht aus Psychose, Schizophrenie, einer Störung schizophrener Form, schwachen Angstzuständen, einer gastrointestinalen Störung und akuter Manie.
11. Olanzapinpolymorph der Form II nach Anspruch 1, das solvattfrei ist.
12. Form II nach Anspruch 11, die weniger als etwa 5 % Form I enthält, wie sie vorher definiert wurde.
13. Form II nach einem der Ansprüche 11 oder 12, die wasserfrei ist.
14. Pharmazeutische Formulierung, die als Wirkstoff die Form II nach einem der Ansprüche 11 bis 13 zusammen mit einem oder mehreren pharmazeutisch annehmbaren Trägern, Hilfsstoffen oder Verdünnungsmitteln hierfür enthält.
15. Pharmazeutische Formulierung nach Anspruch 14, die eine Tablette ist.
16. Pharmazeutische Formulierung nach Anspruch 14, die eine Kapsel oder Tablette ist, welche 1 bis 30 mg der Form II zusammen mit einem pharmazeutisch annehmbaren Träger hierfür enthält.
17. Form II nach einem der Ansprüche 11 bis 13 zur Verwendung bei der Behandlung eines Zustands, ausgewählt aus der Gruppe, die besteht aus Psychose, Schizophrenie, einer Störung schizophrener Form, schwachen Angstzuständen, einer gastrointestinalen Störung und akuter Manie.

Revendications

1. Polymorphe d'olanzapine de forme II possédant un diagramme de diffraction des rayons X de la poudre spécifique tel que représenté par l'écartement des plans ci-après:

- 5 3. Forme II selon la revendication 2, qui contient la forme 1 à concurrence de moins d'environ 2 %.
4. Forme II selon l'une quelconque des revendications 1 à 3, qui est exempte de solvate.
5. Forme II selon l'une quelconque des revendications 1 à 4, qui est anhydre.
- 10 6. Formulation pharmaceutique comprenant, à titre d'ingrédient actif, la forme II selon l'une quelconque des revendications 1 à 5 en association avec un ou plusieurs supports, excipients ou diluants pharmaceutiquement acceptables pour le premier cité.
- 25 7. Formulation pharmaceutique selon la revendication 6, qui représente un comprimé.
8. Formulation pharmaceutique selon la revendication 6, qui représente une capsule ou un comprimé comprenant de 1 à 30 mg de la forme II en association avec un support pharmaceutiquement acceptable pour cette dernière.
- 30 9. Procédé pour préparer la forme II selon l'une quelconque des revendications 1 à 5, comprenant le fait de délayer de l'olanzapine de qualité technique dans de l'acétate d'éthyle dans des conditions anhydres et le fait de cristalliser la forme II à partir de la solution ainsi obtenue.
- 35 10. Polymorphe d'olanzapine de forme II selon l'une quelconque des revendications 1 à 5, à utiliser dans le traitement d'une affection choisie parmi le groupe constitué par la psychose, la schizophrénie, un trouble de forme schizophrénique, l'anxiété peu sévère, un trouble gastro-intestinal et la manie aiguë.
11. Polymorphe d'olanzapine de forme II selon la revendication 1, qui est exempt de solvate.
- 40 12. Forme II selon la revendication 11, qui contient la forme I telle que définie ci-dessus à concurrence de moins d'environ 5 %.
13. Forme II selon l'une quelconque des revendications 11 ou 12, qui est anhydre.
- 45 14. Formulation pharmaceutique comprenant, à titre d'ingrédient actif, la forme II selon l'une quelconque des revendications 11 à 13 en association avec un ou plusieurs supports, excipients ou diluants pharmaceutiquement acceptables pour le premier cité.
15. Formulation pharmaceutique selon la revendication 14, qui représente un comprimé.
- 50 16. Formulation pharmaceutique selon la revendication 14, qui représente une capsule ou un comprimé comprenant de 1 à 30 mg de la forme II en association avec un support pharmaceutiquement acceptable pour cette dernière.
- 55 17. Forme II selon l'une quelconque des revendications 11 à 13, à utiliser dans le traitement d'une affection choisie parmi le groupe constitué par la psychose, la schizophrénie, un trouble de forme schizophrénique, l'anxiété peu sévère, un trouble gastro-intestinal et la manie aiguë.
